

Therefore, the College of Medicine will incorporate into all courses, programs, & individual teaching sessions, opportunities for students to engage in AL. This does not mean that all teaching & learning will be given in small groups. AL can take place within the traditional large or a small group setting for short or long periods of time.

Learning occurs when learners are actively involved in the process. Examples of teaching to promote active learning:

A medical student using a student response system (clicker) in a large class

An example of Write, Pair, Share, an active learning technique for large medical classrooms

A group of medical students organizing hormones into classification systems

Medical students playing Jeopardy in an anatomy class

Can you think of other techniques that actively engage learners?
